New radar-only algorithm: Conceptual model

$$\sigma_{VV} [dB] = Sensitivity * m_v^\lambda + Intercept$$

Sensitivity and Intercept depend on vegetation (Radar Vegetation Index, RVI) and soil roughness (Radar Roughness Index, RRI).

λ is the non linearity coefficient.

Definition of three limiting cases:

- Smooth bare soil (I)
- Rough bare soil (II)
- Maximum vegetation (III)

[REF]: Narvekar, P.S.; Entekhabi, D.; Kim, S.; Njoku, E.G.; , “Soil Moisture retrieval using L-band radar observations ”, IEEE Journal of Selected Topics in Applied Earth Observations and Remote Sensing.

[REF]: Bruscantini, C.; Konings, A.; Narvekar, P; McColl, K.; Entekhabi, D.; Grings, F.; Karszenbaum, H.; “L-band radar soil moisture retrieval without ancillary information”, IEEE Journal of Selected Topics in Applied Earth Observations and Remote Sensing.

•Smooth bare soil (I)

$$\sigma_{VV}^{ss}[dB] = S_S(clf) * m_V^\lambda + \sigma_{VV}^s(clf)$$

•Rough bare soil (II)

$$\sigma_{VV}^{rs}[dB] = S_s(clf)[1 + \log(1 + ks)] * m_V^\lambda + \sigma_{VV}^s(clf) + C\log(1 + ks)$$

•Maximum vegetation (III)

$$\sigma_{VV}^{vff}[dB] = \gamma * m_V^\lambda + \sigma_{VV}^{vf}$$

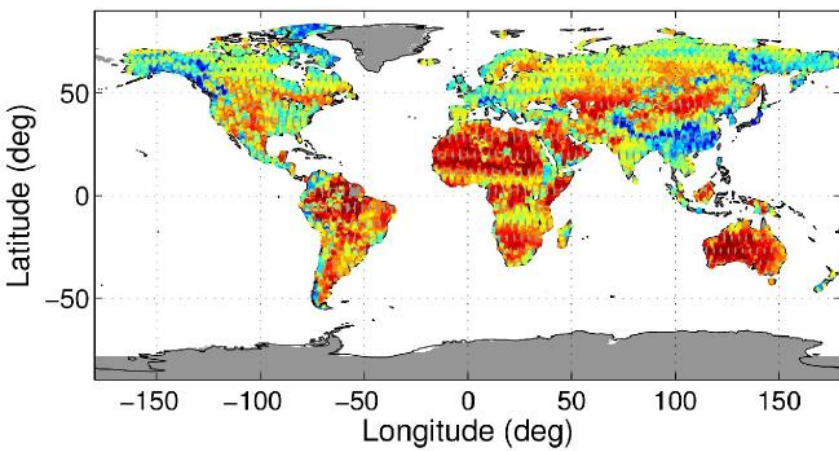

... linearly combining the end members with the RVI index...

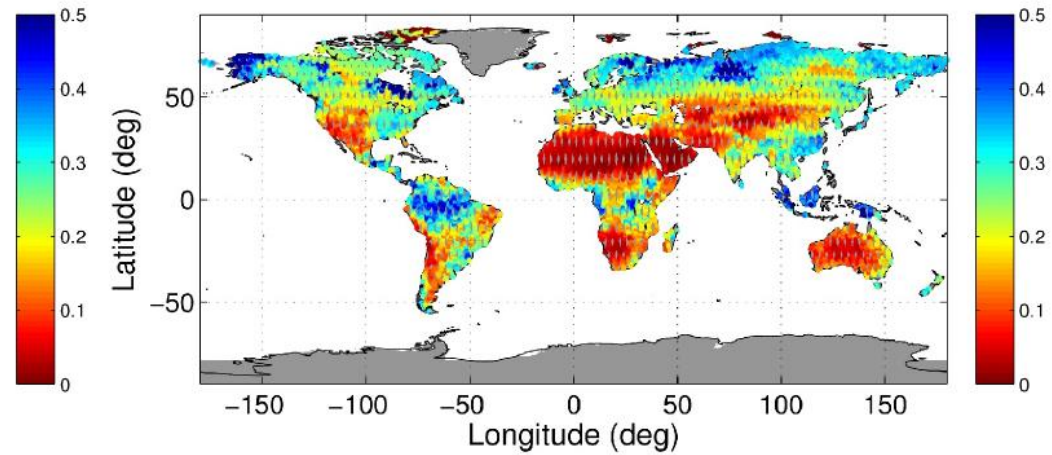

Radar-only soil moisture retrieval

$$\sigma_{VV} = \{RVI\gamma + (1 - RVI)[1 + \log(1 + ks)]S_S\}m_V^\lambda + RVI\sigma_{VV}^{vf} + (1 - RVI)[\sigma_{VV}^s + C\log(1 + ks)]$$

Forward models

Passive model: Omega-tau

$$Tb_V = \Gamma (1 - r_{sV}) T_s + (1 - \Gamma) (1 + \Gamma r_{sV}) (1 - \omega) T_c$$

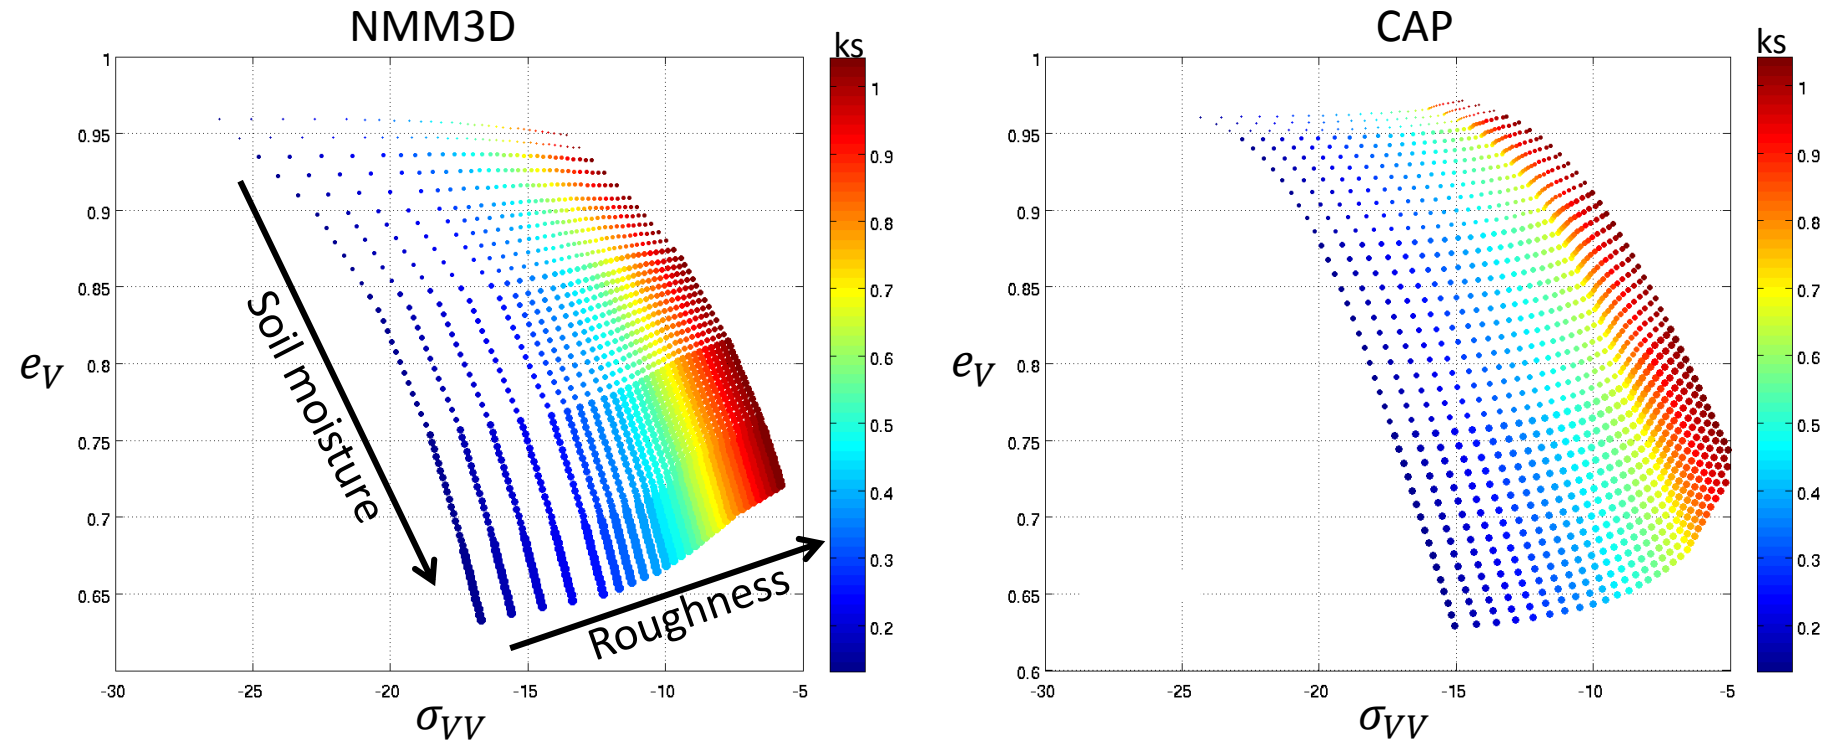

Active model: Radar-only

$$\sigma_{VV}[dB] = S m_V^\lambda + I$$

Coupled by: **roughness** --> h and ks (*bare soil*)
 vegetation --> τ and RVI (*crop dependent*)

- **Summary & Conclusions**

Summary & Conclusions

- ✓ During the 4 years of the Aquarius/SAC-D mission efforts were made towards developing an algorithm for soil moisture retrieval from scatterometer and radiometer observations. An official soil moisture product from Aquarius radiometer is available in NASA NSIDC webpage that uses **only H-pol radiometer observations** and the single channel algorithm.
- ✓ In this presentation we showed that Aquarius scatterometer observations are also useful for soil moisture retrieval using the **radar-only algorithm**, mainly under low to moderate vegetation conditions. The main advantage of this algorithm is that **it does not rely on ancillary information** and it could also be applied to better resolution SAR systems, such as SAOCOM.
- ✓ We also used the radar-only algorithm in combination with the omega-tau model in order to derive an Aquarius **combined active/passive** soil moisture retrieval. Simultaneous radiometer and scatterometer observations provide an opportunity to study the **behavior of active-passive measurements to soil moisture** and their synergy. When a system such as SMAP provides a high resolution radar, the active-passive model allows to retrieve higher soil moisture retrievals with improved accuracy.
- ✓ Because of Aquarius coarse resolution, Aquarius soil moisture is not suitable for agricultural applications. Therefore, we investigate the performance of a **downscaled approach** comparing the obtained **improved resolution Aquarius soil moisture** with SMOS soil moisture.
