Rain Impact Model (RIM)

Goal is to add wind speed (and rain rate) dependence to K_Z

Use 1-D Simulations of Fresh Lenses to Calculate K_Z

- Generalized Ocean Turbulence Model (GOTM)
 - 2nd-order turbulence model
 - dynamic κ - ε TKE equation
- Rain modeled as delivered in a 1-minute pulse
- Constant wind speed (U)
- Vertical evolution of freshwater pulse tracked over 24-hours after rain ends
- Salinity calculated at 60-s time intervals
- Uppermost box for GOTM set at 0.007 m

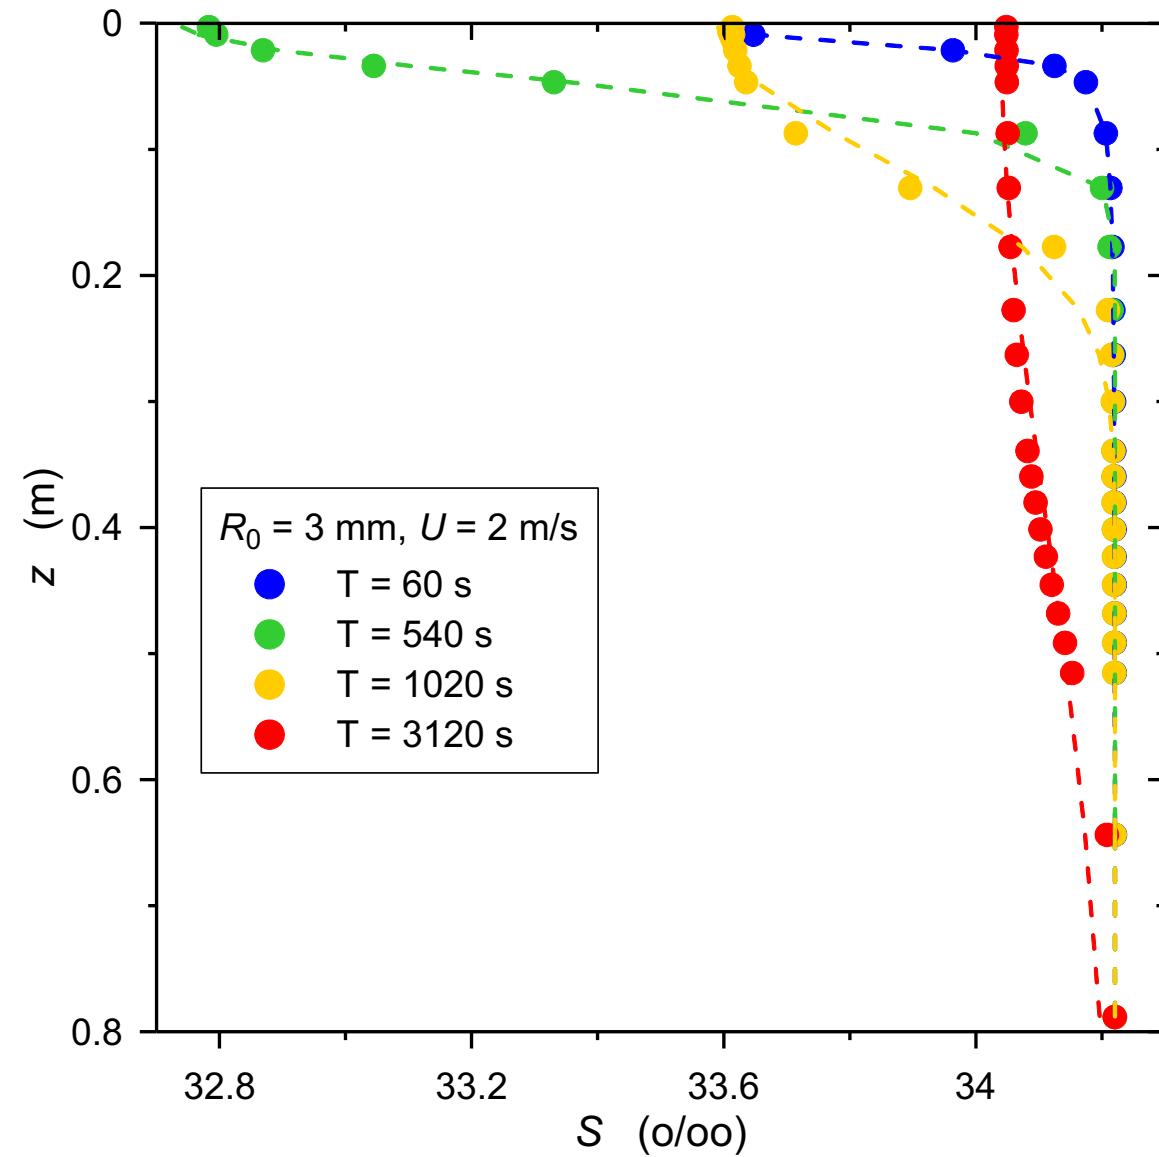

Examples of GOTM Salinity Profiles

Estimating K_Z From GOTM Numerical Data

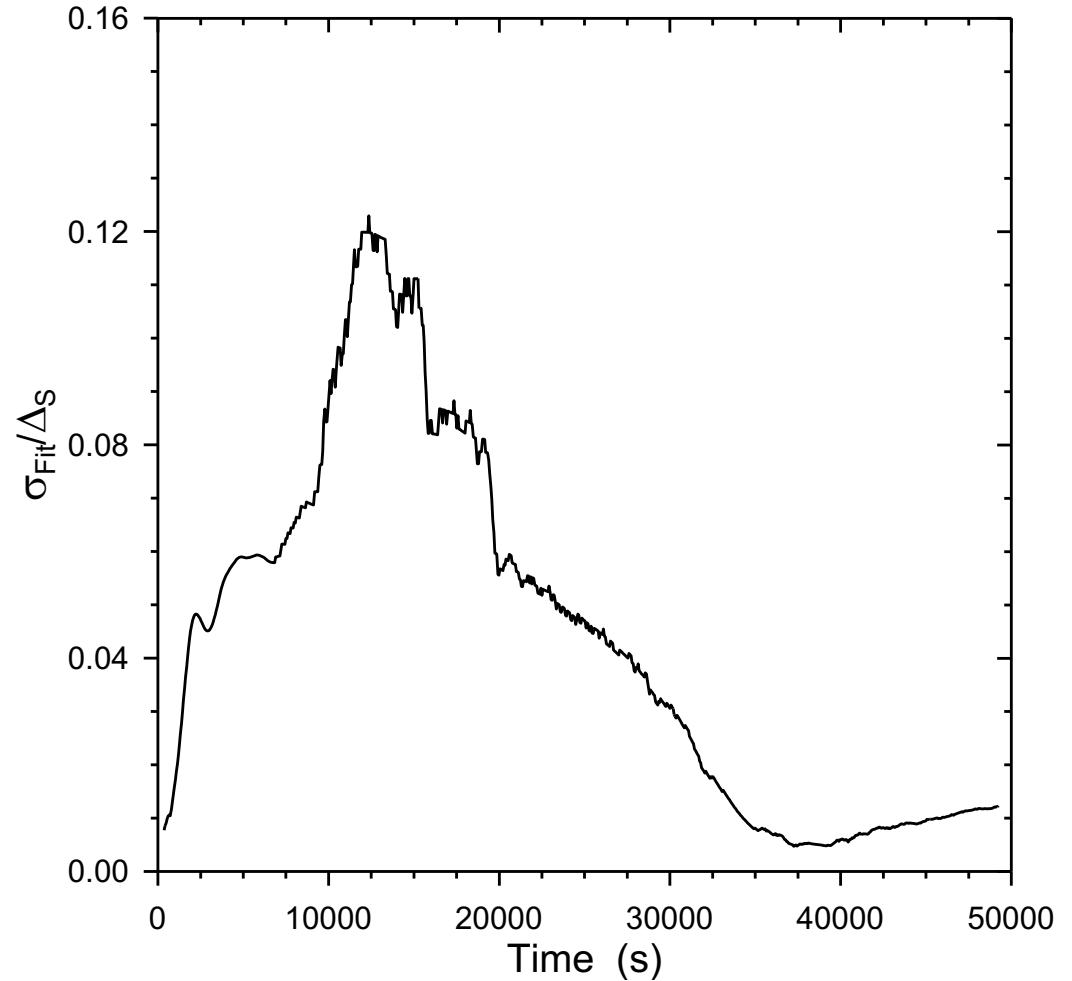

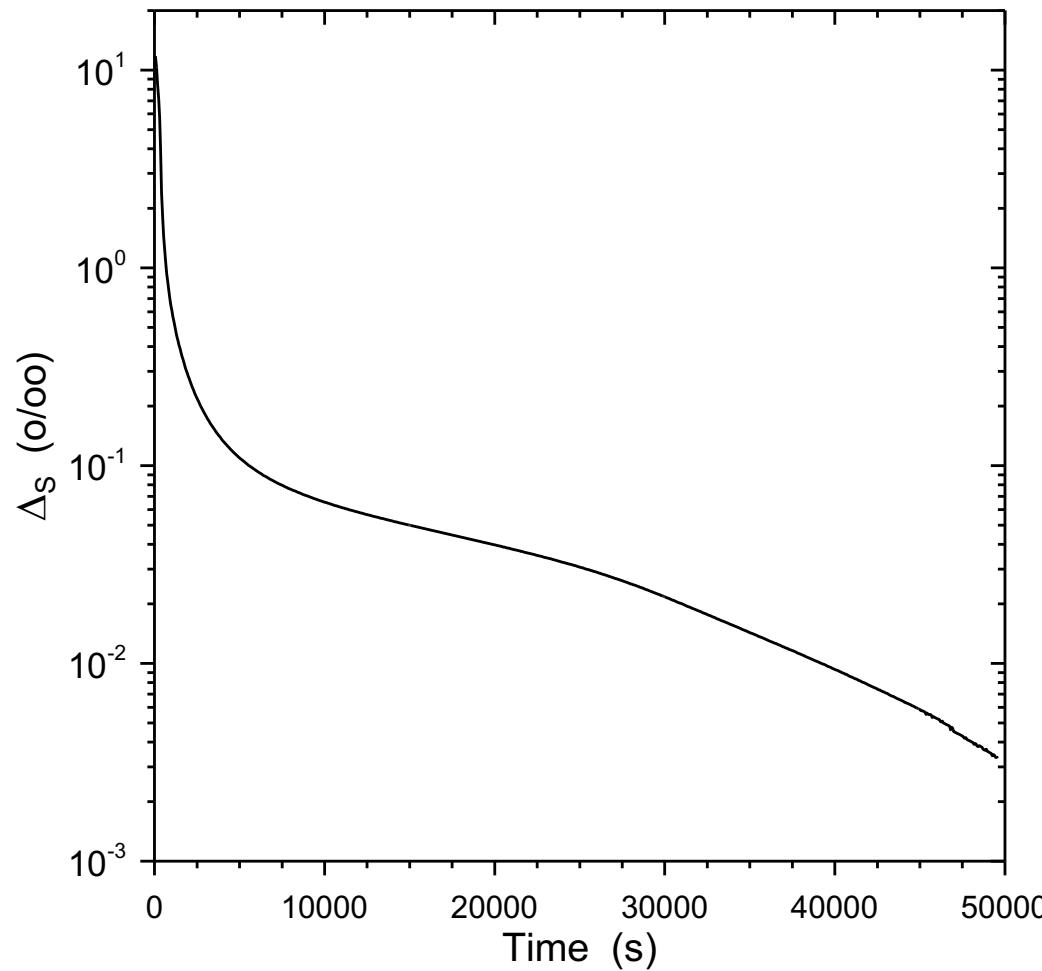

Fit 1-d model:

to GOTM salinity profiles at each time step using d_0 and K_Z as fitting parameters

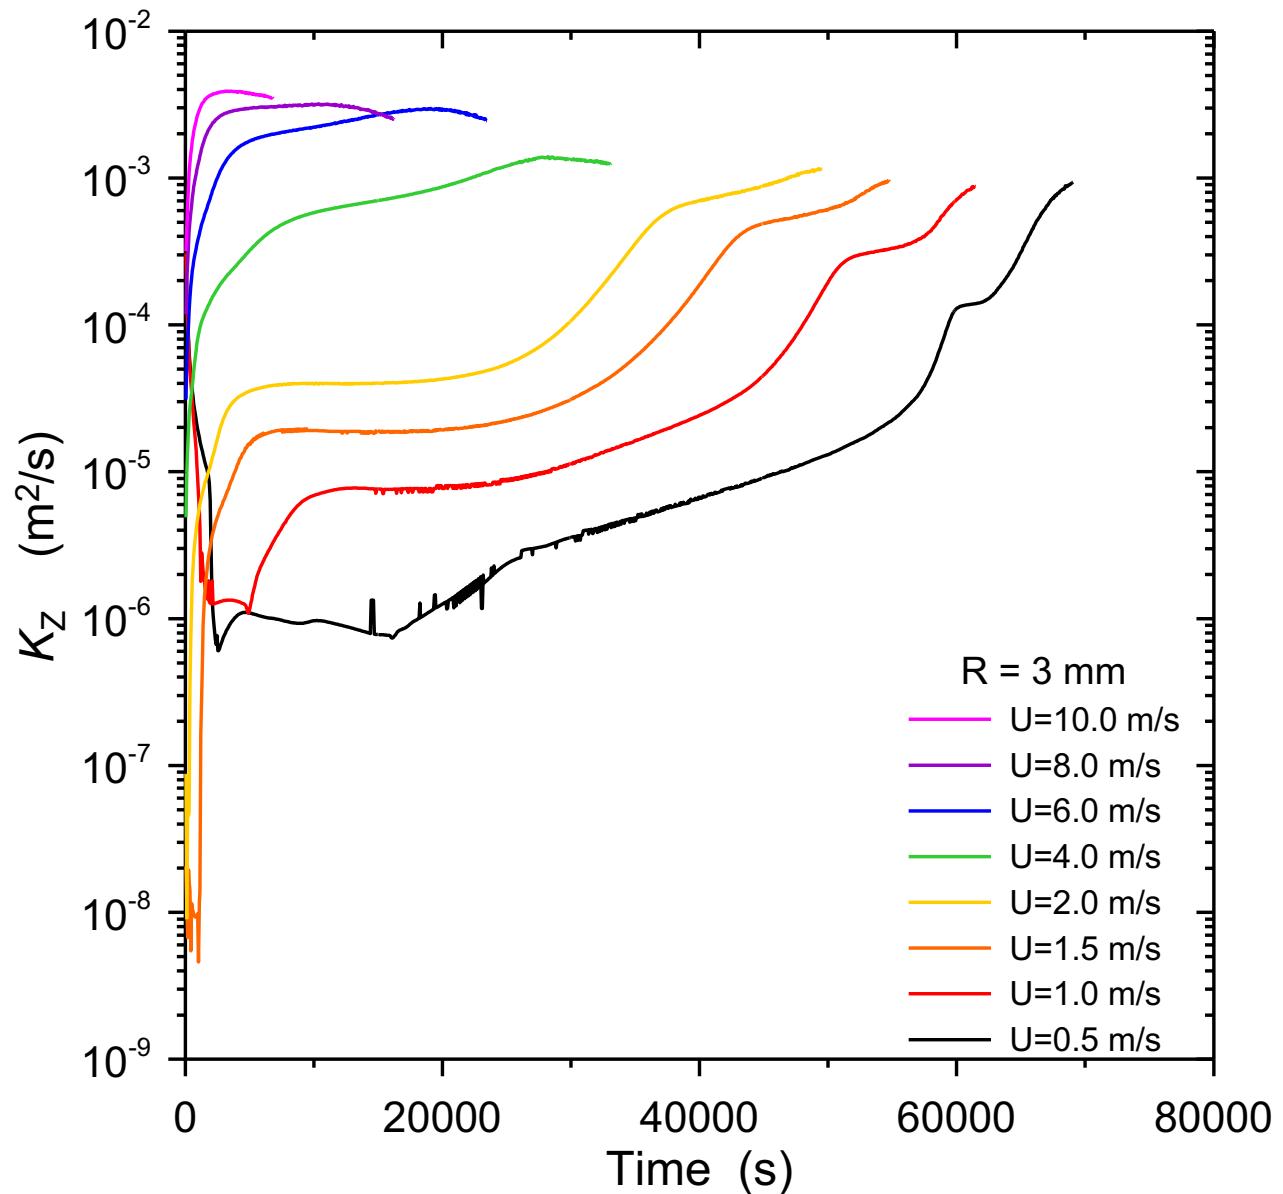

Typical GOTM K_Z Fitting Results

$$U = 2 \text{ m/s} \quad R = 3 \text{ mm}$$

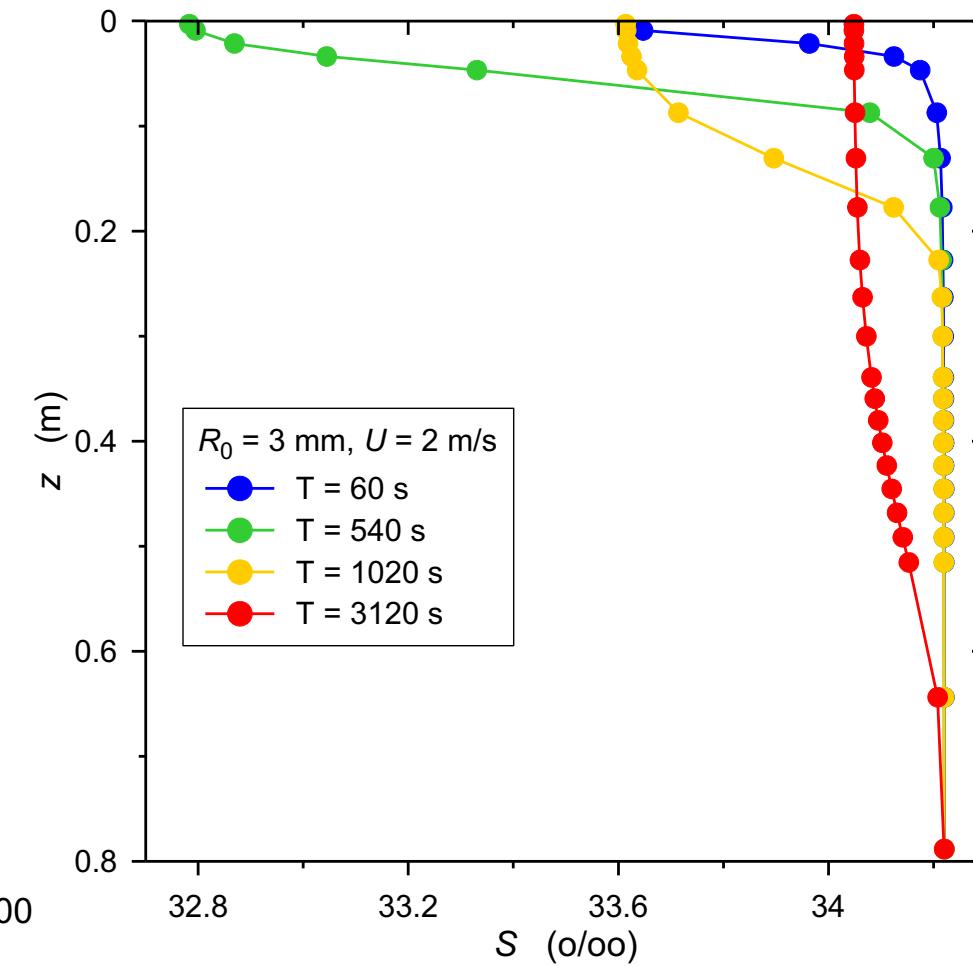

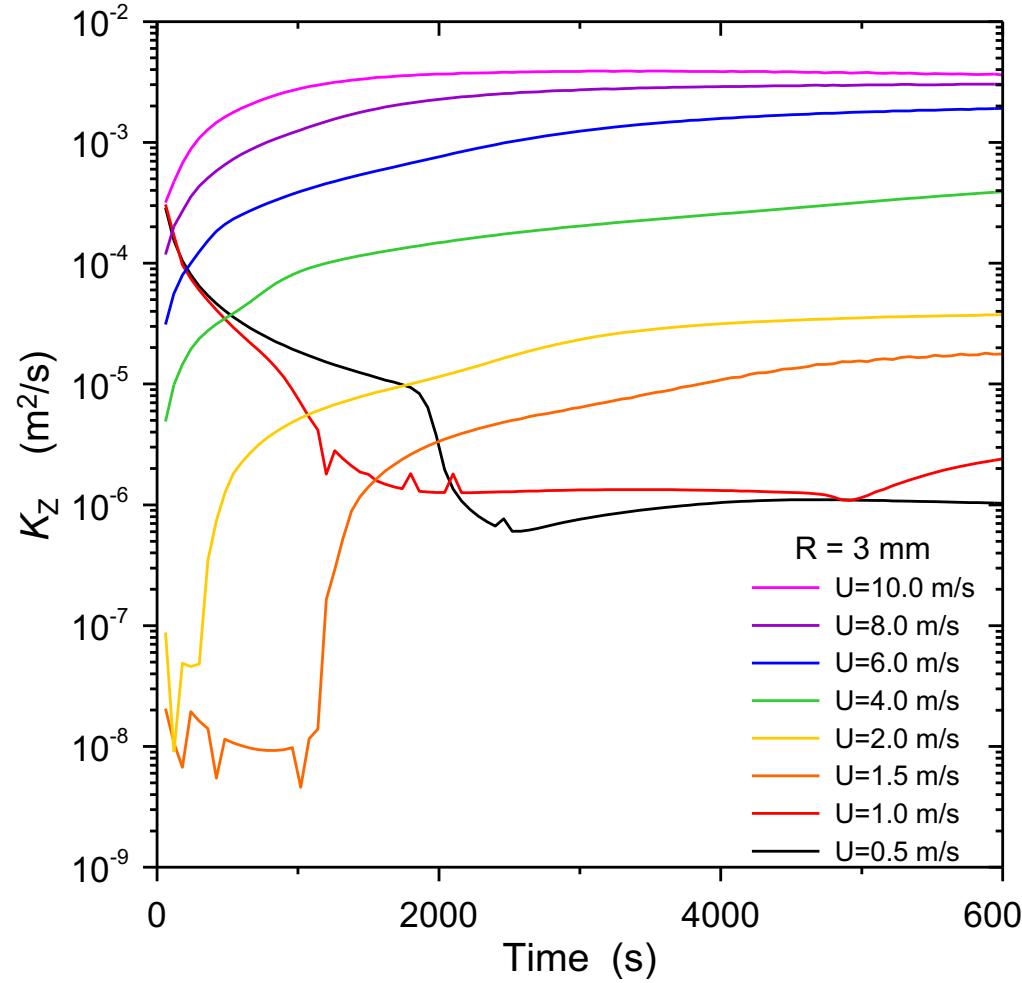

Time Series of K_Z as a Function of U

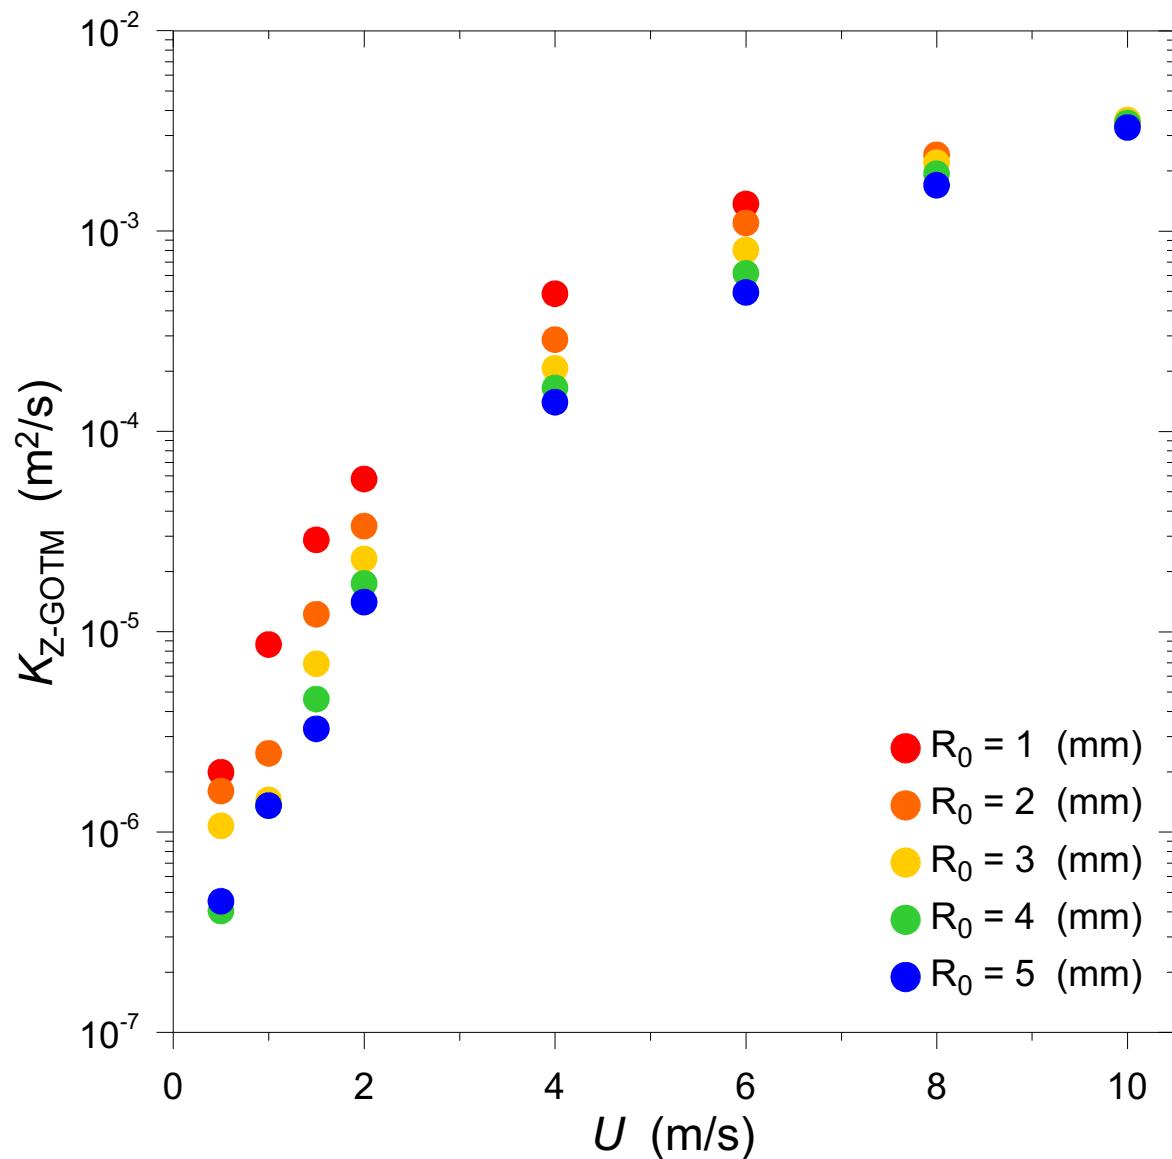

Time Series of K_Z as a Function of U

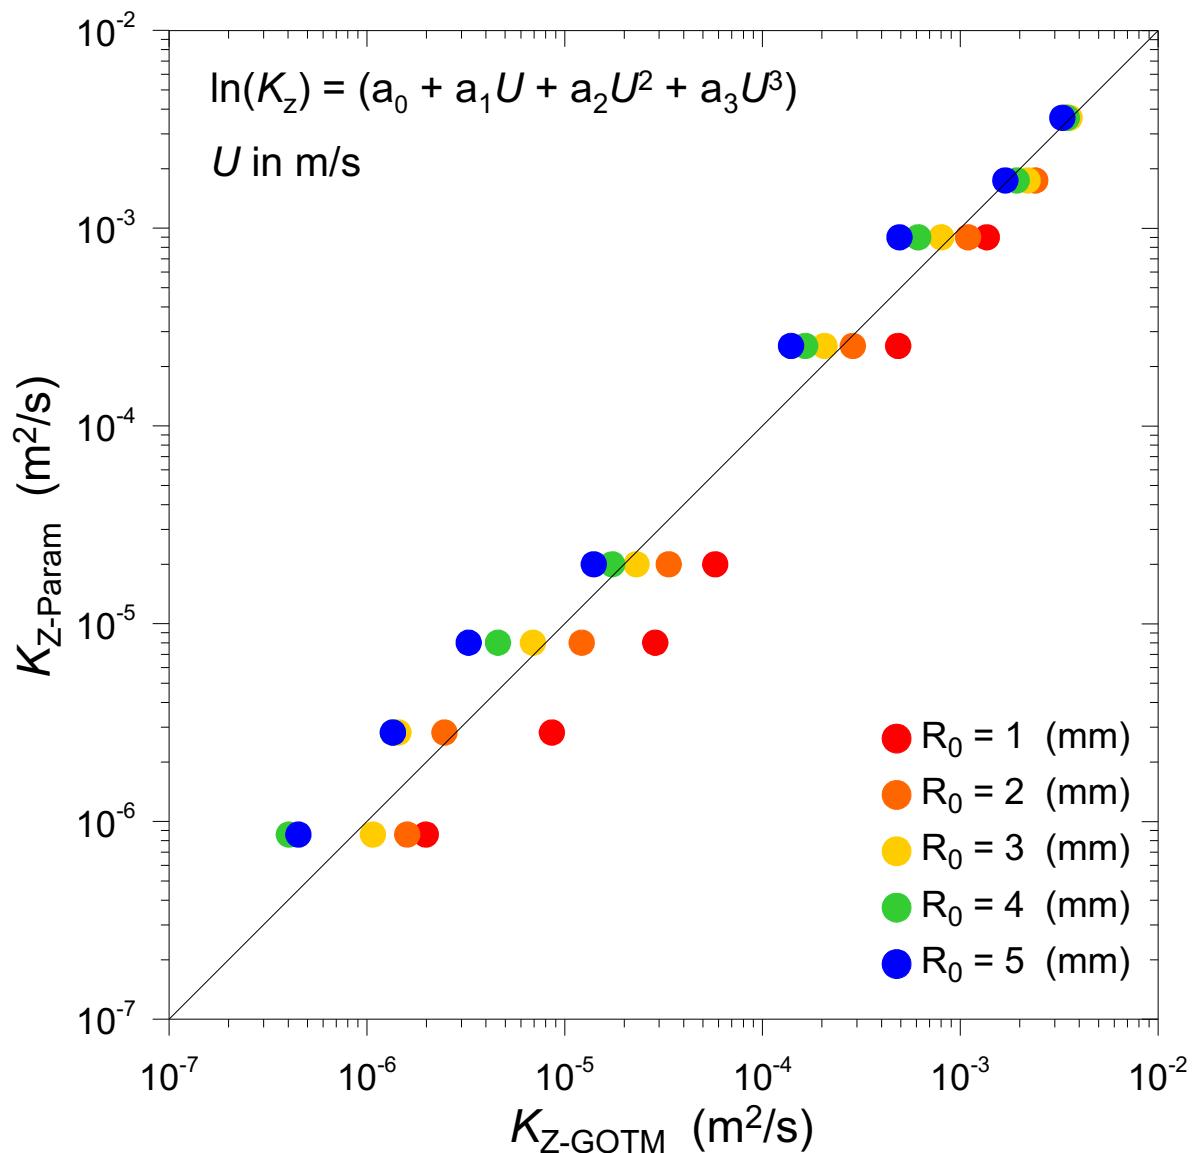

Details

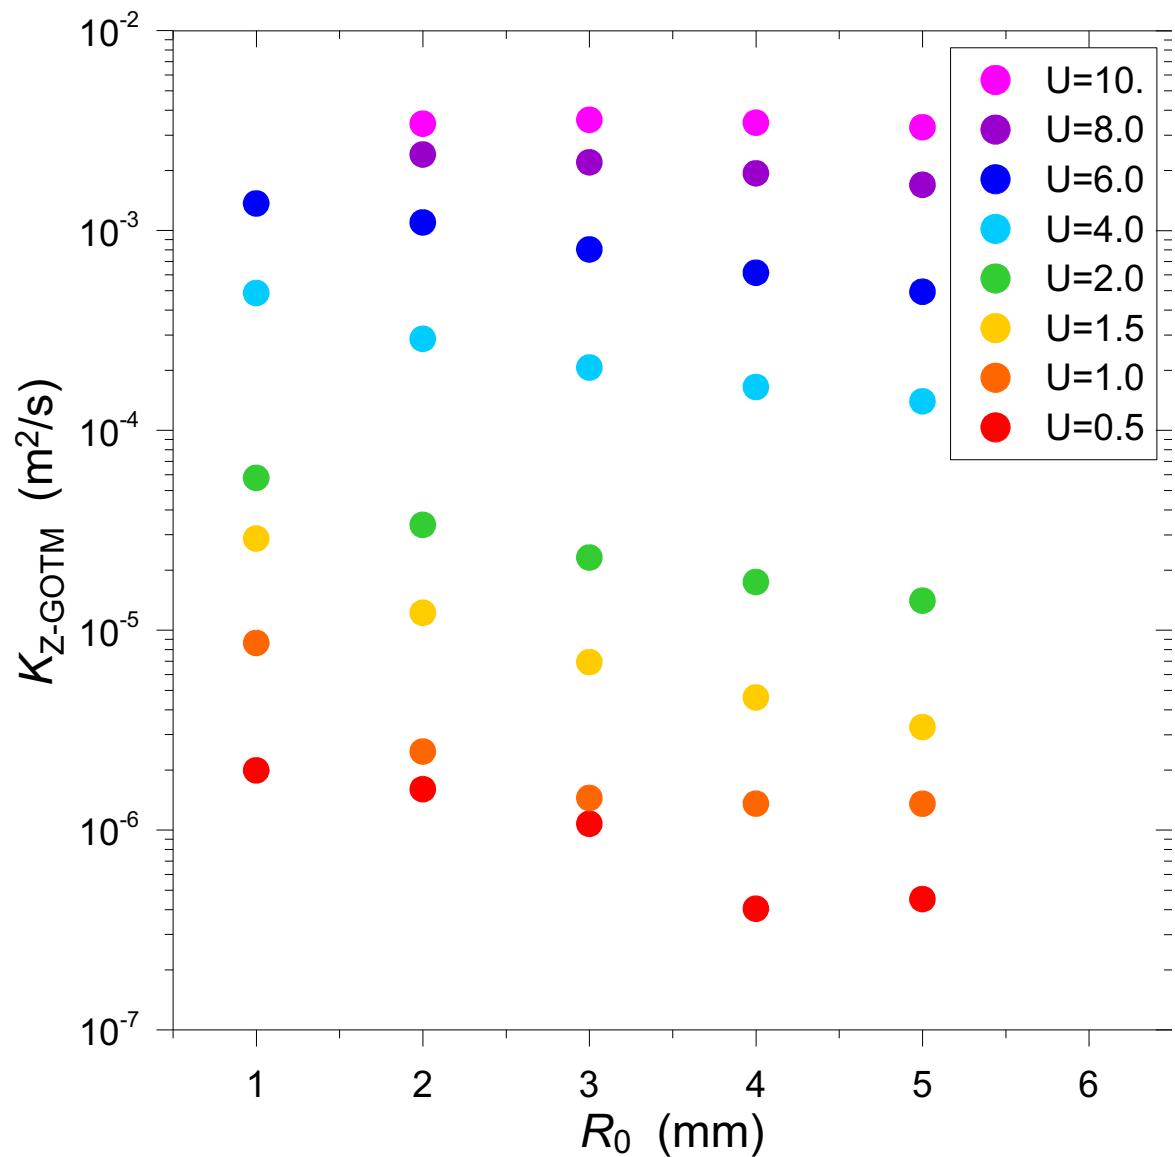

GOTM-Derived K_Z as a Function of U

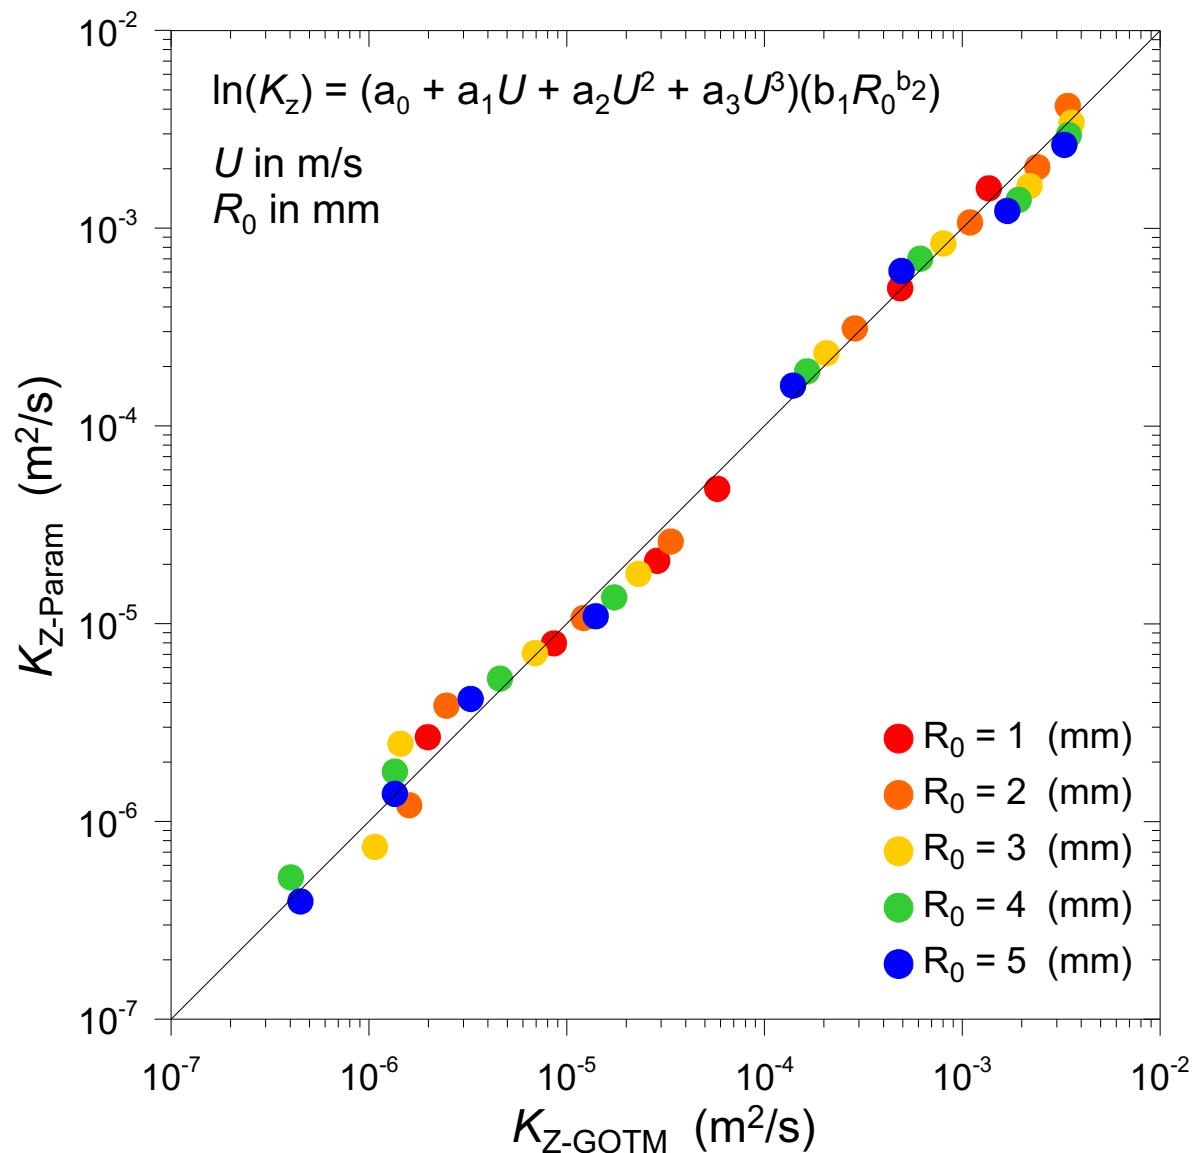

Parameterization of K_Z Including U

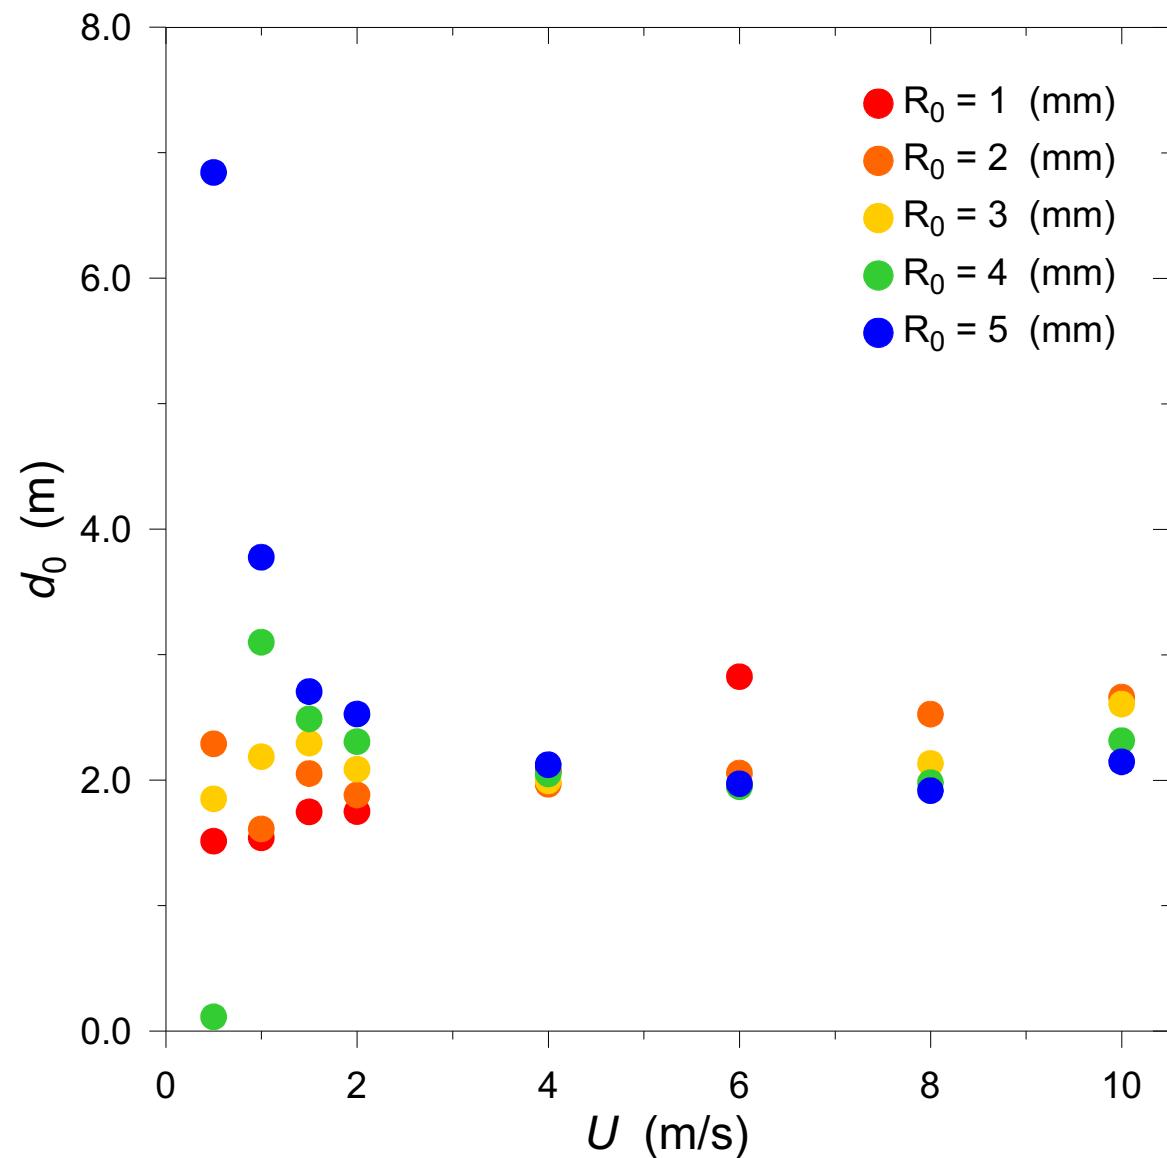

Effect of R on K_Z

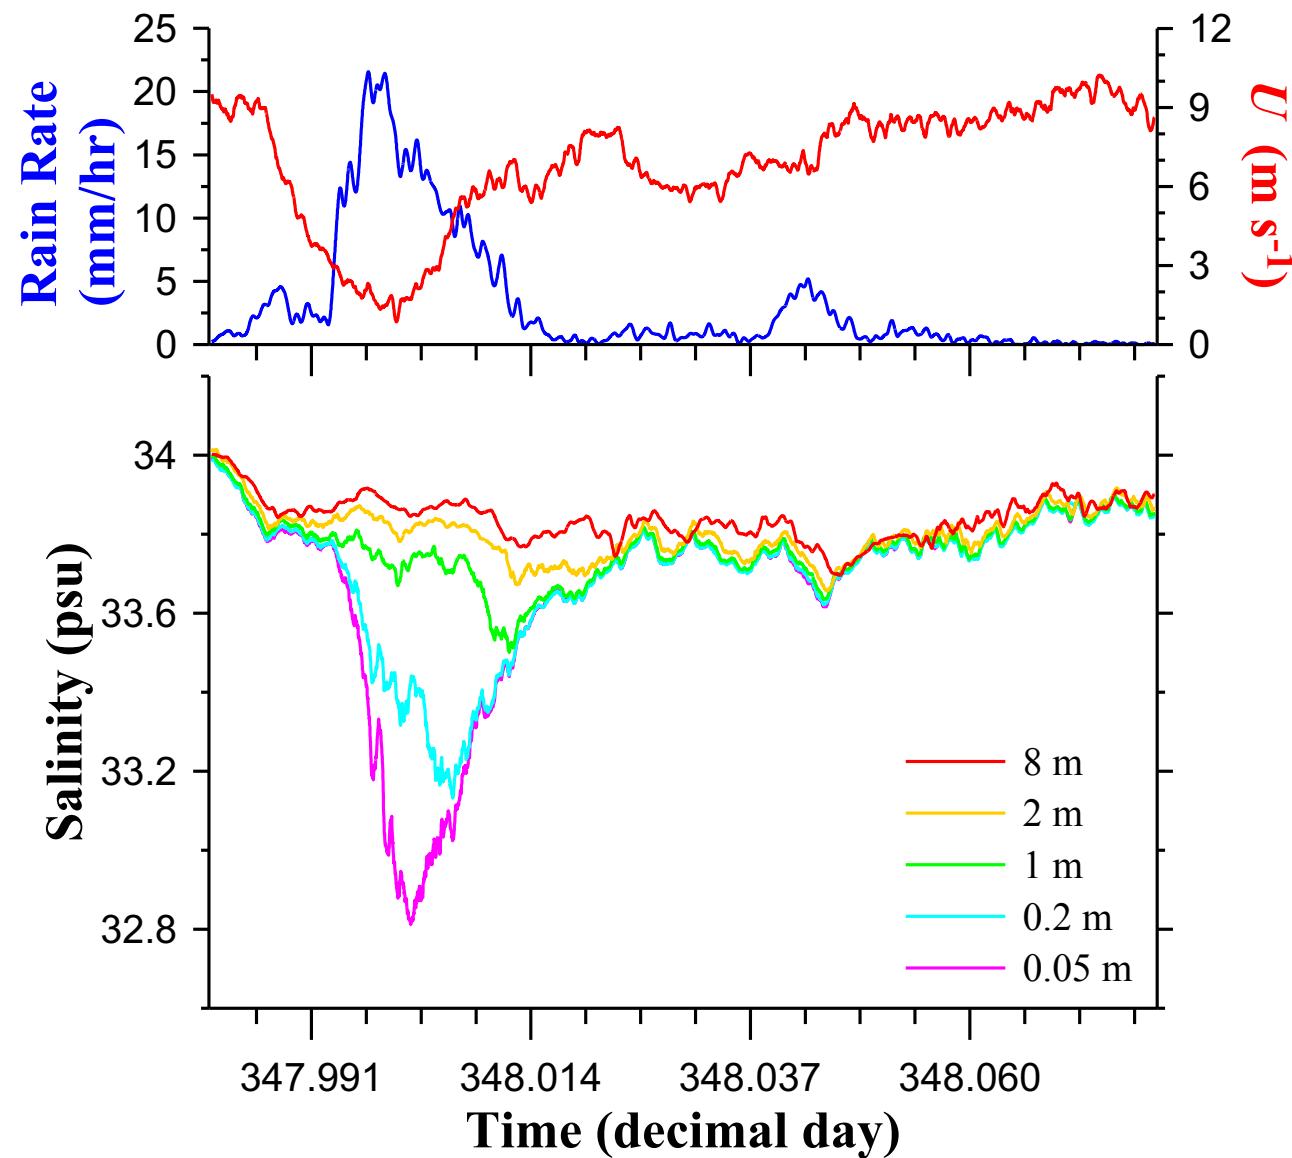

Parameterization of K_Z Including U and R

Results for Fitting d_0

Issues in Using GOTM With Constant U , Boxcar Rain

Conclusions

- Because K_Z appears to be a function of stratification, K_Z is not constant over lifetime of fresh lens even at constant wind speed
- However, by averaging over time, it is possible to develop parameterizations of K_Z in terms of U and R
- It is unclear at this point how to deal with more realistic distributions of rain and wind in terms of developing parameterizations of K_Z
- At wind speeds above ≈ 7 m/s, detailed information about the behavior of K_Z is largely irrelevant for RIM since fresh lenses have short lifetimes
